

ABBYY Timeline

Discover the truth about your process performance and take the guesswork out of automation with process and task mining.

AI-driven process and task mining

ABBYY Timeline is a cloud-based Process Intelligence platform featuring advanced process discovery, analysis, monitoring, and task mining. It uses the latest artificial intelligence (AI) to enable enterprises to automatically build an interactive digital twin of business processes that reveals inefficiencies and process bottlenecks. With this insight, they can apply automation where it will have the greatest impact and predict future outcomes.

ABBYY is trusted by the world's leading enterprises

Process mining

Automate how you discover, analyze, monitor, and improve your processes

Process improvement in four steps

Discovering and mapping

Discover your processes from every angle. Understand how people, processes, and technology interact.

Analysis and optimization

Intimately understand your operations with easy point-and-click tools. See where automation can add value.

Monitoring and alerting

Monitor the impact of automation and improvements on your most important KPIs.

Prediction and forecasting

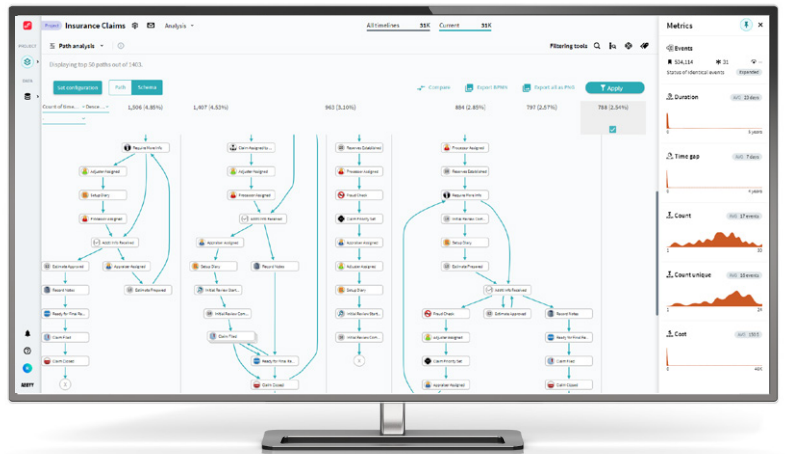

Predict process behaviors and understand next best actions to remove friction from processes.

Key benefits:

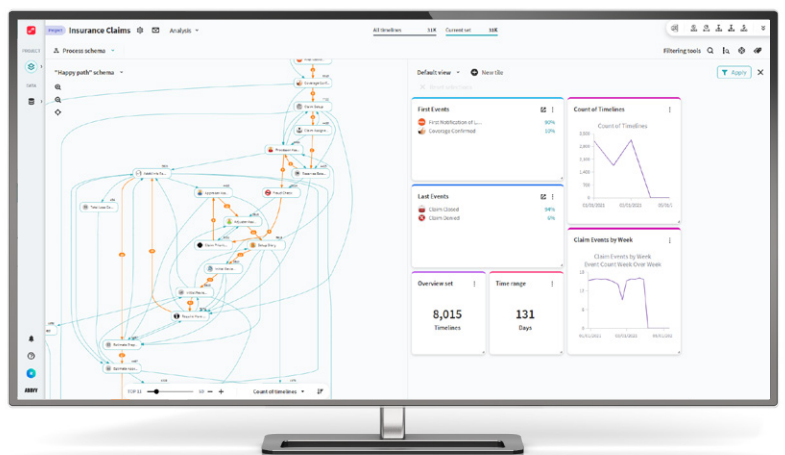

- ✔ Gain a 360-degree view of your business execution
- ✔ Visualize process flow to see the delays, bottlenecks, and outliers
- ✔ Simplify compliance risk management by using audit trails to build process models
- ✔ Achieve greater ROI from automation by identifying high-value opportunities
- ✔ Rely on accurate, unbiased data to make smart decisions
- ✔ Quickly get started with 25+ prebuilt process analysis modules

How process mining works

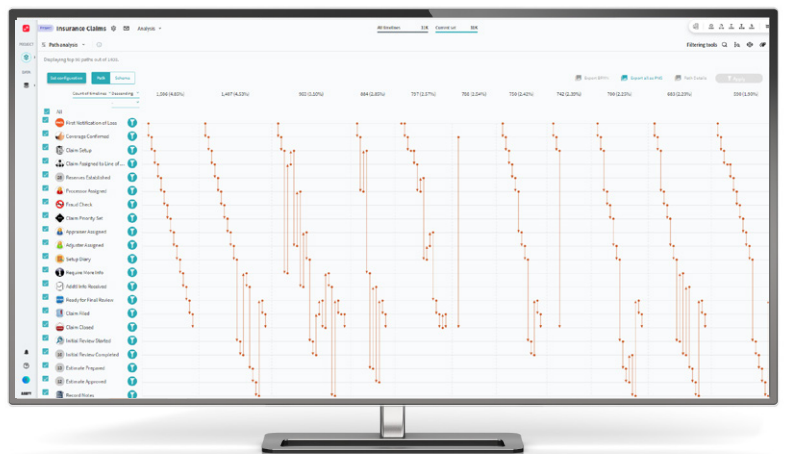

Extract data from any combination of your existing IT systems. As soon as data is loaded, ABBYY Timeline immediately provides profile metrics for your business processes.

Process instances can be analyzed in detail even when different steps in the process are performed on multiple back-end systems. Subprocesses are detected using event pattern analysis.

All process instances are analyzed to identify hidden execution patterns that can be used to detect behaviors that may be beneficial or detrimental to operations.

Task mining

Understand the way your people work to accelerate digital transformation

Timeline analyzes desktop user interaction data to assist organizations in understanding the way people work and how tasks get completed. Combined with process details mined from system event data, task mining enables organizations to enhance operational efficiency, improve customer experience, and accelerate impactful digital transformation.

Task mining helps businesses identify:

Which tasks can be automated

Which tasks are worth automating

How task automation affects the overall process

Wasteful or time-consuming tasks

The best set of tasks necessary to get work completed

Unlock the keys to process excellence

Today's information systems generate an unprecedented amount of data from both digital and physical sources. When properly ingested, merged, and analyzed, this wealth of data can be used to discover patterns and insights that illuminate paths to better customer experiences and new operational efficiencies.

ABBYY Timeline is used by enterprises in many different industries, helping them to achieve these results and more:

- ✔ Save millions of dollars in manual process analysis while drastically reducing costs associated with compliance risks
- ✔ Reduce time to identify opportunities for automation by 50%
- ✔ Achieve 85% faster reporting and production planning time
- ✔ Reduce cycle time by 30% with process redesign

Ready to get started?

ABBYY Timeline is ready to use out of the box, no code needed. Contact us today to get started with your **free trial**.
